"ZOOM AND ENHANCE" CLICHÉ IN TV & MOVIES

- In TV & movies: wrong representation of image enhancing
- **But what if we could actually manually increase the resolution?**
- This challenge is called **Superresolution**.

AGENDA

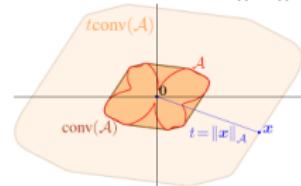

Ground truth

$$x = \sum_{k=1}^r c_k \delta_{\tau_k}$$

recover?

Atomic Norm $\|\tilde{x}\|_{\mathcal{A}}$

$$\inf\{r > 0 : x \in r \text{co}(\mathcal{A})\}$$

is observed as

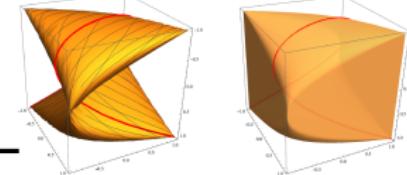

Observed data

$$\tilde{x} = \sum_{k=1}^r |c_k| e^{-2\pi i \varphi_k} \psi(e^{-2\pi i \tau_k})$$

$$\psi(z) = (1, z, z^2, \dots)$$

Atomic Set \mathcal{A}

induces

$$\{e^{-2\pi i \varphi} \psi(e^{-2\pi i w})\}_{w, \varphi \in [0, 1)}$$

PLAN

THE GROUND TRUTH - A SPIKE TRAIN

Consider the spike train

$$x := \sum_{k=1}^r c_k \delta_{\tau_k} \in \mathcal{M}(\mathbb{T}),$$

supported on $T := (\tau_k)_{k=1}^r \subseteq \mathbb{T} = [0, 1)$, where $(c_k)_{k=1}^r \in \mathbb{C} \setminus \{0\}$ are the **amplitudes** of the spikes.

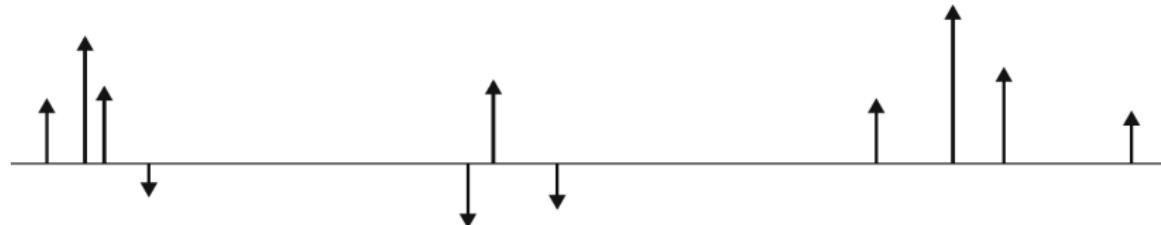

FIG. 1: A spike train with $r = 11$ spikes and real weights $(c_k)_{k=1}^r$.

THE OBSERVED SIGNAL

Resolution limited \implies observed signal is

$$x_{\text{obs}}: \mathbb{T} \rightarrow \mathbb{C}, \quad t \mapsto (x * g)(t) = \sum_{k=1}^r c_k g(t - \tau_k),$$

where $g \in \mathcal{C}(\mathbb{T})$ is such that $\hat{g}(j) = 0$ if $|j| > f_c \in \mathbb{N}$, where
 $\hat{g}: \mathbb{Z} \rightarrow \mathbb{C}$ is the FOURIER transform of g .

Assume $\hat{g}(j) \equiv 1$ for $|j| \leq f_c$.

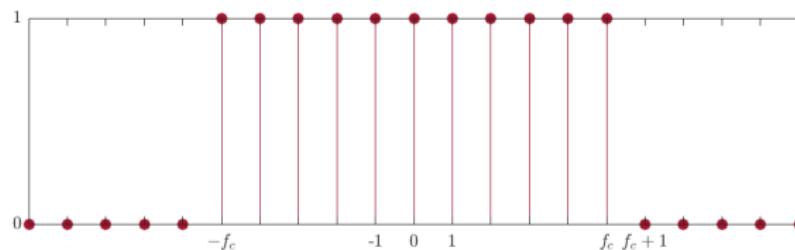

FIG. 2: The FOURIER transform of g .

THE FOURIER TRANSFORM OF THE OBSERVED SIGNAL

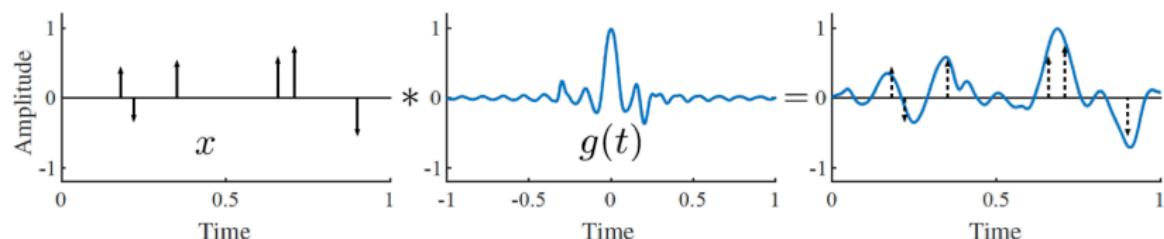

FIG. 3: The observed signal is the convolution of the spike train with a bandlimited function.

The **FOURIER** transform of x_{obs} is

$$\widehat{x_{\text{obs}}} : \mathbb{Z} \rightarrow \mathbb{C}, \quad j \mapsto \hat{x}(j)\hat{g}(j) = \left(\sum_{k=1}^r c_k e^{-2\pi i j \tau_k} \right) \hat{g}(j).$$

INTERIM CONCLUSION

As $\hat{g}(j) = 0$ if $|j| > f_c$, we have $d := 2f_c + 1$ equidistant low frequency measurements $\widehat{x_{\text{obs}}}(j)$ for $|j| \leq f_c$.

→ Convolution with g erases high frequencies of x .

Let $\tilde{x} := (\widehat{x_{\text{obs}}}(j))_{j=-f_c}^{f_c}$ and $\psi(z) := (1, z, z^2, \dots, z^{d-1})^\top$.

Interim conclusion:

$$\begin{aligned} x = \sum_{k=1}^r c_k \delta_{\tau_k} \in \mathcal{M}(\mathbb{T}) &\xrightarrow[\text{measurement}]{\text{yields the}} \tilde{x} = \sum_{k=1}^r c_k \psi(e^{-2\pi i \tau_k}) \in \mathbb{C}^d \\ &= \sum_{k=1}^r |c_k| e^{-2\pi i \varphi_k} \psi(e^{-2\pi i \tau_k}) \end{aligned}$$

SIGNAL DECOMPOSITION

- Goal: **decompose** signal $\tilde{x} \in \mathbb{K}^d$ ($\mathbb{K} = \mathbb{R}$ or \mathbb{C}) into **finite nonnegative** linear combination **with respect to** $\mathcal{A} \subseteq \mathbb{K}^d$:

$$\tilde{x} = \sum_{a \in \mathcal{A}} c_a a, \quad c_a \geq 0.$$

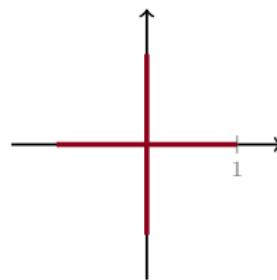

- ~~~ \exists infinitely many expansions of \tilde{x} . How to choose?
- Solve

$$\min_u \|c\|_0 \quad \text{such that} \quad \tilde{x} = \sum_{a \in \mathcal{A}} c_a a, \quad c_a \geq 0,$$

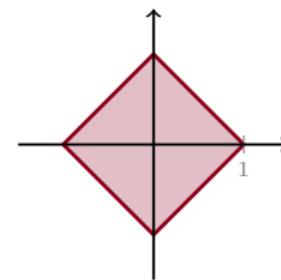

where $\|c\|_0 := \#\{a \in \mathcal{A} : c_a \neq 0\}$.

- But $\|\cdot\|_0$ is **not convex** and "not robust".

FROM CARDINALITY MINIMISATION TO ℓ_1 MINIMISATION

(a) The unit ball of the $\|\cdot\|_0$ function.

(b) The unit ball of the ℓ_1 norm.

FIG. 4: The convex hull of (a) is (b).

\rightsquigarrow instead solve

$$\min_c \|c\|_1 \quad \text{such that} \quad \tilde{x} = \sum_{a \in \mathcal{A}} c_a a, \quad c_a \geq 0.$$

Goal of next section: show that $\|\tilde{x}\|_{\mathcal{A}}$ is that minimum value

WHEN IS THE GAUGE A NORM?

Let X be a *normed space*.

DEFINITION (GAUGE)

The **gauge** of a subset $A \subseteq X$ is

$$p_A: X \rightarrow [0, \infty], \quad x \mapsto \inf\{r > 0 : x \in rA\},$$

where $\inf(\emptyset) := \infty$.

THEOREM (NORM PROPERTIES)

If $A \subseteq X$ is a nonempty, convex, bounded, rotation invariant, fulldimensional set, then p_A is a norm on X .

rotation invariant: $rA = A \ \forall |r| = 1$.

fulldimensional: A contains open neighbourhood of 0.

PROOF OF THE THEOREM ABOUT NORM PROPERTIES

(i) $p_A(x) < \infty \forall x \in X$.

A fulldimensional $\implies \exists \rho > 0$ such that $B_\rho(0) \subseteq A$. Let $x \in X$ and $r := \frac{2}{\rho} \cdot \|x\|$, then $x \in rB_\rho(0) \subseteq rA$, as $\left\| \frac{x}{r} \right\| = \frac{\rho}{2} < \rho$.

(ii) $p_A(x) = 0 \implies x = 0$.

Take $x \in X$ with $p_A(x) = 0$. $\exists (r_n)_{n \in \mathbb{N}} \in \mathbb{R}_+$, $r_n \rightarrow 0$ such that $x \in r_n A \ \forall n \in \mathbb{N}$. Assume $\exists \varepsilon > 0$ with $\|x\| > \varepsilon$.

$$\lim_{n \rightarrow \infty} \frac{1}{r_n} \|x\| \geq \lim_{n \rightarrow \infty} \frac{\varepsilon}{r_n} = \infty,$$

to the boundedness of A .

PROOF OF THE THEOREM ABOUT NORM PROPERTIES

$$(iii) \ p_A(x + y) \leq p_A(x) + p_A(y) \quad \forall x, y \in X.$$

Note: $x \in \lambda A \implies p_A(x) \leq \lambda$.

Let $x, y \in X$ and $\varepsilon > 0$. $\exists \lambda, \mu > 0$ such that

$$\lambda \leq p_A(x) + \frac{\varepsilon}{2}, \quad \mu \leq p_A(y) + \frac{\varepsilon}{2} \quad \text{and} \quad \frac{x}{\lambda}, \frac{y}{\mu} \in A.$$

A convex, so

$$\frac{\lambda}{\lambda + \mu} \frac{x}{\lambda} + \frac{\mu}{\lambda + \mu} \frac{y}{\mu} = \frac{x + y}{\lambda + \mu} \in A.$$

Thus

$$p_A(x + y) \leq \lambda + \mu \leq p_A(x) + p_A(y) + \varepsilon \xrightarrow{\varepsilon \searrow 0} p_A(x) + p_A(y).$$

PROOF OF THE THEOREM ABOUT NORM PROPERTIES

$$(iv) \ p_A(\lambda x) = |\lambda| p_A(x) \quad \forall \lambda \in \mathbb{K}, x \in X.$$

Let $x \in X$. A fulldim. $\implies 0 \in A \implies 0 \in rA \quad \forall r > 0$, so

$$p_A(0 \cdot x) = p_A(0) = \inf\{r > 0\} = 0 = |0|p_A(x).$$

For $\lambda > 0$

$$\begin{aligned} p_A(\lambda x) &= \inf\{r > 0 : \lambda x \in rA\} = \inf\left\{r > 0 : x \in \frac{r}{\lambda}A\right\} \\ &= \inf\{\lambda r > 0 : x \in rA\} = \lambda \inf\{r > 0 : x \in rA\} \\ &= \lambda p_A(x). \end{aligned}$$

A rotation invariant $\implies \lambda A = |\lambda|A$, so

$$\lambda x \in rA \iff |\lambda|x \in rA.$$

EXTREME POINTS OF CONVEX SETS

DEFINITION (EXTREME POINT OF A CONVEX SET)

A point $x \in C$ in a *convex* subset $C \subseteq X$ is an **extreme point** of C and we write $x \in \text{ex}(C)$ if there does not exist an open line segment contained in C that contains x , that is, the relations $x = \lambda y + (1 - \lambda)z$ for $y, z \in C$, $y \neq z$ and $\lambda \in [0, 1]$ imply that $\lambda = 0$ or $\lambda = 1$ and thus $x = y$ or $x = z$.

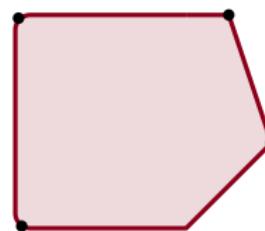

FIG. 5: The black dots are some extreme points of the set.

ATOMIC SETS AND THE ATOMIC NORM

DEFINITION (ATOMIC SET)

A set $\mathcal{A} \subseteq \mathbb{K}^d$ is an Atomic Set if \mathcal{A} is compact, rotation invariant and a subset of $\text{ex}(\text{co}(\mathcal{A}))$ and $\text{co}(\mathcal{A})$ is fulldimensional.

$\{a(w, \varphi) := e^{-2\pi i \varphi} \psi(e^{-2\pi i w}) : w, \varphi \in [0, 1]\}$ is an Atomic Set. \square

DEFINITION (ATOMIC NORM)

The Atomic Norm induced by an Atomic Set $\mathcal{A} \subseteq \mathbb{K}^d$ is the gauge on $\text{co}(\mathcal{A})$:

$$\|\cdot\|_{\mathcal{A}}: \mathbb{K}^d \rightarrow [0, \infty), \quad x \mapsto \inf\{r > 0 : x \in r \text{co}(\mathcal{A})\}.$$

REPRESENTATION OF THE ATOMIC NORM

Atomic norm solves the decomposition problem:

THEOREM (REPRESENTATION OF THE ATOMIC NORM)

For an Atomic Set $\mathcal{A} \subseteq \mathbb{K}^d$ and $\tilde{x} \in \mathbb{K}^d$ we have

$$\|\tilde{x}\|_{\mathcal{A}} = \inf \left\{ \|c\|_1 : \tilde{x} = \sum_{a \in \mathcal{A}} c_a a, \ c_a \geq 0 \right\}.$$

IV. ATOMIC SETS AND THE ATOMIC NORM

V. DUAL PROBLEM AND RECOVERY

VI. REFERENCES

DUALITY

- Goal: find $\|\tilde{x}\|_{\mathcal{A}}$
- Dual problem (we have **strong duality**):

$$\max_{p \in \mathbb{C}^d} \langle \tilde{x}, p \rangle_{\mathfrak{R}} \quad \text{subject to} \quad \|p\|_{\mathcal{A}}^* \leq 1,$$

where $\langle x, y \rangle_{\mathfrak{R}} := \Re(\langle x, y \rangle)$ and

$$\|p\|_{\mathcal{A}}^* := \sup_{\substack{a \in \mathbb{K}^d: \\ \|a\|_{\mathcal{A}} \leq 1}} \langle p, a \rangle_{\mathfrak{R}} = \sup_{a \in \mathcal{A}} \langle p, a \rangle_{\mathfrak{R}}.$$

- Plugging in the form of the atoms $a \in \mathcal{A}$ we obtain

$$\|p\|_{\mathcal{A}}^* = \max_{w \in [0,1)} |\langle \psi(e^{2\pi i w}), p \rangle|$$

SEMIDEFINITE FORMULATION FOR $\|p\|_{\mathcal{A}}^* \leq 1$

THEOREM (NONNEGATIVE TRIGONOMETRIC POLYNOMIALS AND HERMITIAN GRAM MATRICES)

For $p \in \mathbb{C}^d$, the following are equivalent.

1. We have $|\langle \psi(e^{2\pi i w}), p \rangle_{\mathfrak{R}}| \leq 1$ for all $w \in [0, 1]$.
2. There exists a HERMITIAN matrix $Q \in \mathbb{C}^{d \times d}$ such that

$$\begin{pmatrix} Q & p \\ p^H & 1 \end{pmatrix} \succeq 0 \quad \text{and} \quad T^*(Q) = e_0,$$

where $T^*(Q)_k = \text{Tr}[\Theta_k Q]$ and Θ_k is the TOEPLITZ matrix whose first row is the k -th unit vector e_k , where $k \in \{0, \dots, d-1\}$.

↪ Dual problem can easily be solved by convex solvers

LOCALISING THE FREQUENCIES

- Let \tilde{p} be the **solution of the dual problem**. Then

$$\{\tau_k\}_k = \{w \in [0, 1) : |\langle a(w, 0), \tilde{p} \rangle| = 1\}.$$

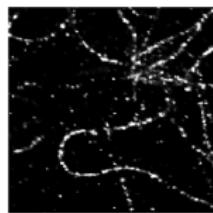

~ \rightarrow the **spike locations are the extrema** of $|\langle a(\cdot, 0), \tilde{p} \rangle|$
~ \rightarrow find **roots of a polynomial** on the unit circle.

- Using support estimate T_{est} , the c_j can be reconstructed by solving the system

$$\sum_{\tau_j \in T_{\text{est}}} c_j e^{-2\pi i k \tau_j} = \tilde{x}_k, \quad |k| \leq f_c$$

using *least squares*.

CONCLUSION

is observed as

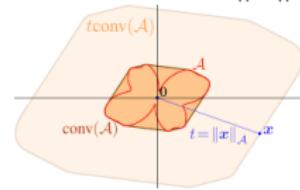

Ground truth

$$x = \sum_{k=1}^r c_k \delta_{\tau_k}$$

recover?

Atomic Norm $\|\tilde{x}\|_{\mathcal{A}}$

$$\inf\{r > 0 : x \in r \text{co}(\mathcal{A})\}$$

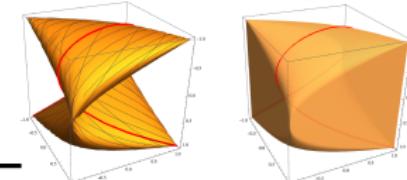

Observed data

$$\tilde{x} = \sum_{k=1}^r |c_k| e^{-2\pi i \varphi_k} \psi(e^{-2\pi i \tau_k})$$

$$\psi(z) = (1, z, z^2, \dots)$$

Atomic Set \mathcal{A}

induces

$$\{e^{-2\pi i \varphi} \psi(e^{-2\pi i w})\}_{w, \varphi \in [0, 1]}$$

Thank you for your attention!
